

basic.fc

economical dampening solution
fine filtration

basic.fc

Advantages at a glance

- Good filtration quality at a low price
- Extended dampening solution life-cycles
- Production conditions are stabilised
- Suitable for ipa-reduced printing
- High operational safety
- Auto-off when filters are blocked
- Easy retrofitting
- Optional: UV disinfection available

technotrans basic.fc

view in the basic.fc

With basic.fc, the starter system for dampening solution fine filtration, technotrans offers an economic choice for higher productivity in the press room.

The easy, triple-stage filtration unit keeps the entire system clean – from the tank to the trays of the printing units. Druckmaschine.

Dampening solution fine filtration

The triple-stage filtration system efficiently removes extremely small dirt particles down to a dust-size of 5 µ. The extended dampening solution life-cycle increases the press uptime. The bypass method of the basic.fc guarantees easy, troublefree operation. The dampening solution circulation to the printing press remains unaffected, which ensures stable production conditions.

As a plus, the basic.fc can be activated by external units so it is always ready when needed.

technotrans alpha.f and beta.f go beyond the basic.fc and are other comprehensive filtration solutions for various applications in small and large format sheetfed offset printing.

The filtration system minimises the amount of cleaning that is needed, and therefore, considerably decreases the operating costs, while the press uptime is maximised.

Various different performance versions ensure you have the optimum solution, balancing your needs and budget.

We would be glad to advise you on the selection of the ideal fine filtration system for your individual requirements.
